

## Claims

What is claimed is:

1. A method of communicating via satellite in a system comprising a satellite having a first type antenna capable of transmission of communication signals to a region on the earth's surface and a plurality of earth stations disposed in said region, each earth station having a second type antenna capable of reception of said signals, said method comprising;  
transmitting from said first type antenna multiple sub-beams within bandwidth allocated to a basic spot beam to said plurality of antennas in said region.
2. A method as claimed in 1, where said sub-beams are transmitted within the frequency range of said basic spot beam.
3. A method as claimed in 1, where said sub-beams are transmitted in a plurality to form a cluster, where said cluster has the same coverage area in said region as said basic spot beams.
4. A method as claimed in 1, where said sub-beams are transmitted by use of a phased array antenna.
5. A method as claimed in 1, wherein the number of said sub-beams  $N$  are defined by the mathematical equation  $N=i^2+j^2+ij$ , where  $i$  and  $j$  are non-negative integers.
6. A method as claimed in 1, wherein said sub-beams require less peak gain than said basic spot beam.
7. A method as claimed in 3, where said clusters are transmitted so as to form a coverage area, said coverage area is a contiguous area defined by a matrix, where each facet of said matrix has interlocking borders, said borders defined as the contours of said spot beams.

8. A method as claimed in 6, where each sub-beam is defined by a contour level, said contour level determined by a required edge gain.

9. A method as claimed in 8, wherein the gain relationship between said basic spot beams and said sub-beams can be defined by the equation  $G_b - x_b = G_s - x_s$  where  $G_b$  and  $G_s$  refer to said peak gain values of said basic spot beams and said sub-beams respectively, and  $x_b$  and  $x_s$  denote the contour levels for which each beam is defined.

10. A method as claimed in 9, wherein the peak gain of said antenna can be related to its half power beam width (hpbw),  $\theta_3$  by an the equation  $G = 10 \log \left( \frac{A}{\theta_3^2} \right)$ , where A is a constant partly defined by antenna efficiency.

11. A method as claimed in 10, wherein the beamwidth of a phased array at an arbitrary contour level to its hpbw is determined by the equation  $\theta_x = \theta_3 * 0.59 * x^{0.4806}$ , where the units of the beamwidth are in degrees.

12. A method as claimed in 9, wherein the contour levels of said basic and said sub-beams can be related to their beamwidths by the equation  $9.612 \log \left( \frac{x_s}{x_b} \right) + x_b - x_s = 20 \log \left( \frac{\theta_s}{\theta_b} \right)$ , where  $\theta_b$  is basic beamwidth and  $\theta_s$  is sub-beam beamwidth.

13. A method as claimed in 4, wherein said transmission originates from a low or medium earth orbiting system.

14. A method as claimed in 1, wherein said basic beam has 3 or more dB of gain drop.

15. A method as claimed in 1, wherein said sub-beam has less than 1 dB of gain drop.

16. A method as claimed in 1, wherein said sub-beams number 4 or more.

17. A communications system comprising a satellite having a first type antenna capable of transmission of communication signals to a region on the earth's surface and a plurality of earth stations disposed in said region, each earth station having a second type antenna capable of reception of said signals;

a phased array antenna;

a digital beam former that produces multiple sub-beams within the parameters of a basic spot beam; and

an aperture sized to produce sub-beams with a gain drop of less than 3 dB.

18. A system as claimed in 17, where said antenna and digital beam former are installed on a satellite.

19. A system as claimed in 18, where said satellite is in low or medium Earth orbit.

20. A satellite antenna comprising;

a phased array antenna;

a digital beam former operatively connected to said phased array and adapted to produce multiple sub-beams, each said sub-beam having a gain that at its peak is approximately equal to an edge gain.
